

Water Quality Update

September 22, 2021

OWSI crew flushed the water mains today and the water is clearing up. There was water testing done in the system. In some areas the water was within normal parameters. In some areas the water was elevated in iron and higher than normal manganese. The water will be tested tomorrow and flushed where needed.

Iron and Manganese are secondary contaminants.

What are secondary water contaminants?

National Secondary Drinking Water Regulations-NSDWRs (or secondary standards) are **non-enforceable guidelines regulating contaminants that may cause cosmetic effects** (such as skin or tooth discoloration) or aesthetic effects (such as taste, odor, or color) in drinking water.

If you experience water with color in it please send an email to owsi@portludlowassociates.com and let us know your location. We will send a technician to flush that area during working hours.
